

ULTRA FAST SEQUINS FOR BRILLIANT EFFECTS

HIGH PERFORMANCE SEQUIN DEVICE V4

THE ART OF EMBROIDERY

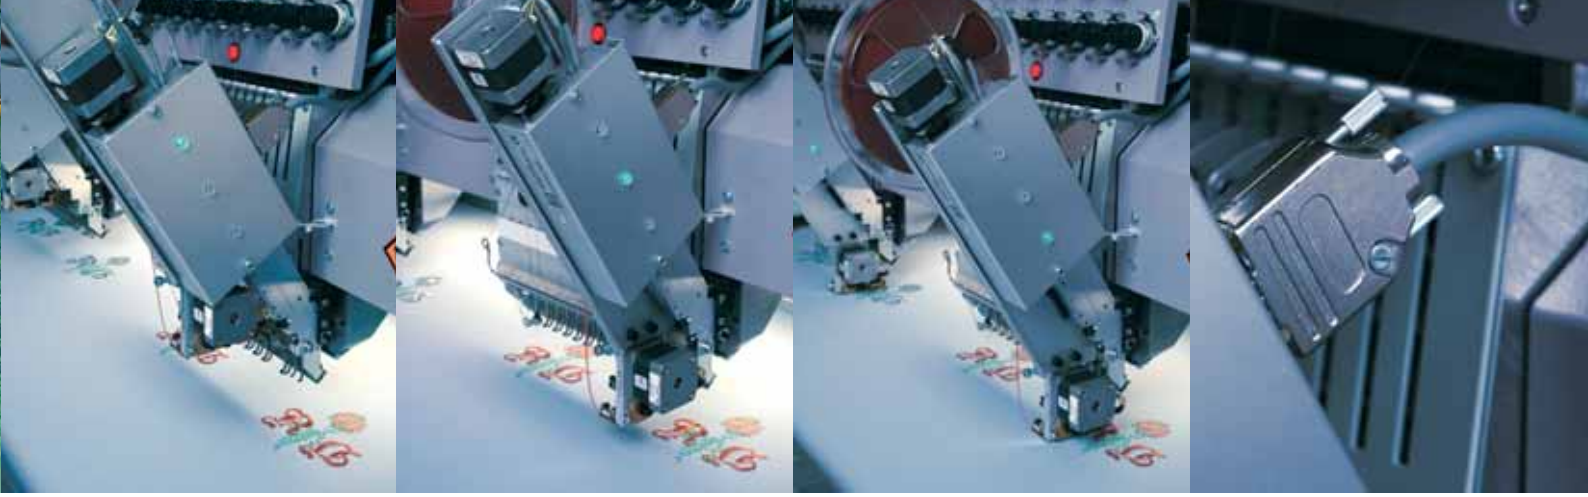

“The special effect embroidery machines know no bounds except for your fantasy.”

Christian Moll, manager marketing ZSK

CHALLENGE OUR MACHINE WITH YOUR FANTASY

For more than 10 years sequin devices from ZSK have been holding a top position in the global market. In addition to the unique precision and outstanding productivity, the speed of these high-performance devices (real 1,000 stitches per minute) is especially convincing.

The special embroidery procedure developed by ZSK engineers allows the application of 250 instead of 200 sequins per hour. For a business-minded embroiderer this means a productivity increase of 25 (!) percent compared to other makes.

Professional embroiderers are thus provided with high-performance devices allowing them to profit to a considerable extent from the continuous boom of sequins.

- The maximum embroidery speed of the sequin device amounts to 1,000 rpm. In case of the triple-fastening stitch, 25 percent more sequins can be applied compared to other makes.
- Compressed air is not required.
- The sequin device is available for sequins from 3 to 9 mm.
- The entire lifting and/or lowering process is effected mechanically and takes only 2 seconds.
- Three LEDs show the respective position of the device: operating position, intermediate position and resting position.
- In case of non-continuous segmented designs the intermediate position is approached and the upper resting position is only approached at the end of the design or in case of thread breakage.
- For convenient assembly, the connection between the head cable and the sequin device is provided with a threaded plug.
